How can i patch a dll using winhex or wmsdk????? Is there a way to fix the issue of the cheat cs1.6 core.dll 13 I need to use the dll to host the cheat locally after patching. Played cs 1.6 non steam the other day, it was an awesome game. Edit: thanks to all the answers I used mireko's answer, and it worked.. A: There are two files in your game folder, one of them is being replaced by the re-downloaded file from CS:GO and it is the core.dll. The Core is a part of the game engine that is what you run when the game is running, the main executable is demoplayer.dll. The Windows DLL System Patch (WDSP) is what is being updated, when you patch an executable, there are multiple files that are replaced. You will need to perform the following actions: Stop Steam using the Steam Controller while patching, or the process will crash when it tries to replace the game executable. Unzip the CS:GO installer file to a folder containing only the game executable. Replace the core.dll and demoplayer.dll files in the game executable with the new core.dll and demoplayer.dll files from the CS:GO installer. Start Steam again. NOTE: The Core file is newer than the main executable. Additionally, an Anti-Cheat Engine (AC-Engine) may have found and disabled the cheat, in this case, the cheat will not work until Steam has updated the malicious engine. When working with the AC-Engine, when it detects a cheat, it will automatically update and force patch the executable. When patching an executable, the WDSP will attempt to replace the following: The core.dll The demoplayer.dll The steammerlin.dll The steam_api.dll The icemgr.dll More files will be patched as well, such as input.dll, plugman.dll, tf_cfs_stalker.dll and more. NOTE: The cheat will patch the core.dll and demoplayer.dll. You will need to patch the executable to only replace the core.dll and demoplayer.dll. If you need to patch the executable to only replace core.dll
