## Windows Server 2008 R2 Crack Activation

M. Windows Server 2016 Standard Server Gold. Microsoft Windows 10 OS and activation keys in One place. M. Sep 1, 2016.

Q: How to create session variable in C# and read it from JSP? I have a page in which I create a session variable and I want to read it in another page. Can anyone please tell me how can I read session variable created in one page and use it in another page?

A: Here is an example of how to store session variables and retrieve them from a JSP page  
`Session session = Request.Session;  
session.setAttribute("var1", "value"); // store session attribute  
Response.Redirect("otherPage.jsp"); // retrieve session attribute`

`Object attributeValue = session.getAttribute("var1"); // assign session attribute to string  
String sessionString = (String) attributeValue; // display session attribute  
Response.Write("" + sessionString + "");`  
A: You don't create session variables at run time. You create session variables at design time and they are stored for later use. The "variable" you would access from within

the JSP page would be the Session object. To store a value, use the Session.setAttribute method:  
`Session session = request.getSession(true);  
session.setAttribute("var1", "value");`  
You would then access the value from within the JSP page by using the Session object:  
`var1 = session.getAttribute("var1");`  
Hope that helps.  
Q: Bash: Awk / Sed delimiter issues I'm trying to use Awk and Sed in order to parse a specific format string. I can do this with Perl, but I want to learn bash and awk and Sed. I have a sample text file (input.txt) that looks like this:  
1. The text1 with the version 1.1  
2. The text2 with the version 2.0  
3. The text3 with the version 3.1  
4. The text4 with the version 4.0  
If I try the following:  
`awk '/^V$/ {print; next} {print; exit}' input.txt`  
I get the expected output:  
1. The text1 with the version 1
