To find out whether you are already infected by a specific malware or if your PC is affected by a new variant, check out a special version of the malwarescanner that uses the newly discovered scanning technique. This Malwarebytes' Anti-Malware Premium Beta is the first product to implement the Portable engine and uses a new type of scanning. Portable engine not only saves disk space by creating a compact executable, but it also allows malwarescanner to determine whether a malware is currently active. In most cases, a binary executable includes only the malicious code; the rest is empty, which means that it can be removed and replaced by a clean file, leaving no trace. The Portable engine uses the scanning results to build a whitelist or blacklist of malware. This enables it to easily identify which known malicious files should be deleted. Besides the portable engine, malwarescanner also includes a new 'System Files' component, which allows you to detect and remove infected system files in a precise manner, rather than relying on the results of the Portable engine. A multi-threaded engine runs in the background to provide a reliable scan of your machine, enabling you to work on your files while the scan is carried out. The malwarescanner includes a new user interface that allows you to easily run scans and removes malwares with a single click. The interface is customizable so you can change the settings to meet your own needs. Malwarebytes' Anti-Malware Premium Beta is a free version of the full-featured product. You will need to register a new user account in the product in order to use it, but the registration is free. PCs come with lots of default programs, many of which you rarely use and hardly ever see.
