Anti-inflammatory effect of methanolic extract from the stem bark of *Lindera strychnifolia* (Lauraceae). The stem bark of *Lindera strychnifolia* L.f. (Lauraceae), a native species from Southwestern China, is commonly used as a fever-reducing and hemostatic herb in traditional medicine in East Asia. However, there is no scientific evidence to support this traditional use, and the pharmacological actions of the stem bark have not yet been reported. In this study, the methanolic extract of the stem bark of L.

strychnifolia (MESL) was investigated for its anti-inflammatory effects in vitro and in vivo. The hot-plate test was used to screen for possible centrally acting analgesic properties of MESL. In addition, the effects of MESL on the expression of tumor necrosis factor-alpha (TNF- $\alpha$ ) and interleukin-1beta (IL-1 $\beta$ ) were evaluated in lipopolysaccharide (LPS)-induced RAW 264.7 cells. To generate the last file you need to enter your key and a new file will be generated (the new file is always in D:\Program Files\Autodesk\AutoCAD\2010). Source [Relation between measured and true 5-HT in the nuclei of the dorsal and median raphe]. Hundred of 5-HT of rats was measured by gas chromatography with electron capture detector and of the same animals true 5-HT was determined by a modification of KARSKI method. There was no correlation between the measured and the true 5-HT in both the dorsal and median raphe nuclei. It is concluded that the amount of 5-HT that can be measured by gas chromatography in the neural tissue in rats does not necessarily represent the true amount of 5-HT. -- Copyright (C) 2001 Bill Billowitch. -- Some of the work to develop this test suite was done with Air Force -- support.
