not require additional license to use the integrity checker and can be used as a replacement for the integrity checker in Windows Data Protection. Integrity Checker does not replace Windows Data Protection. Integrity Checker also monitors partitions of NTFS, FAT32, and exFAT file systems. It monitors file and folder integrity as well as preventing possible corruptions caused by hard disk or partition failures. Integrity Checker Features Integrity Checker is a simple utility that checks files and folder integrity, file version tracking, file ownership and group status, last access date and time, and last write time. In addition, a recent modification timestamp is checked. Integrity Checker now supports data integrity checks even when all file system switches are enabled. Integrity Checker checks data on all partitions of a disk. Integrity Checker allows setting file size limits for file and folder integrity checks, which prevents excessive file integrity checks on potentially very large data. Integrity Checker supports NAS and NAS-based Network Attached Storage (NAS), including Filer, File Lock, and File Server types of NAS. With data protection, file and folder integrity is always checked. Integrity Checker is capable of generating hash stamps and file integrity stamps. Integrity Checker integrates the integrity checker into the operating system by using System Center Application Management and the service manager. Integrity Checker allows file or folder integrity checks to be interrupted if the integrity checker encounters a critical error. Integrity Checker will not perform integrity checks on files or folders that are scheduled for deletion in Windows Explorer. Integrity Checker performs integrity check on files that you add or delete without using the Add or Delete button in Windows Explorer. Integrity Checker performs integrity checks on files in any folder that you navigate to in Windows Explorer. Integrity Checker automatically 6a5afdab4c
