Key systems provide strategic and tactical support for your operations and analyze real-time information on your system's health, performance, and availability so you can get ahead of problems before they impact performance. That's where Key comes in. A working knowledge of Tally and Excel is enough Key plays the role of a key system, which means that it's supposed to be installed on your key systems. One of the parameters to determine its installation is the availability of Virtualization. Whether or not your PC is available for virtualization will determine whether or not you can install Key on it. More or less advanced users should be able to perform the installation process without any kind of problem, but to be completely honest, for all those looking to get a deeper understanding of the process, the included Quick Start guide is a great resource. According to its manufacturer, the tool is capable of repairing and updating several different kinds of operating systems, and so you should be able to install it on both 32-bit and 64-bit Windows versions. Supports Intel AMT technology Another good thing is that Key is quite customizable. As such, you should be able to adapt and optimize it for any system. This means that not only can you train it to monitor more than 100 systems, you can also define the rules for the alarms you're going to receive, their thresholds, and much more. Has useful tools for analyzing performance Since Key is also designed to analyze performance, it comes with a page that details all the program's supported hardware as well as its most relevant features. One of the interesting things is that the utility comes with a robust tool that allows you to check your data transfer and storage speed. Furthermore, Key has important features that enable you to analyze system performance. For example, to analyze CPU performance, you can use the CPU utilization graph, the CPU performance graph, the maximum bandwidth graph, or the maximum packet size graph. You can also look at system memory, the physical address, the cache, or the processor caches, and even CPU temperature.
