Windows-based applications and extensions AutoCAD is used to create Windows-based applications and extensions. As AutoCAD is primarily written in the.NET Framework, developers can use.NET to build Windows-based applications that can access AutoCAD data as well as execute AutoCAD commands. Many of these applications are utilities that perform a specific function, and do not require the full functionality of AutoCAD. Some of the more popular applications are listed below. Free AutoCAD extensions AutoCAD Extensibility Toolkit (AUTOCAD X-E2) is a free application that allows creation of extensions for AutoCAD. It provides support for plugin architecture and enables individual components to be licensed separately. References Category:Computer-aided design software Category:Technical communication tools Category:3D graphics software Category:Computer-aided design software for WindowsThis invention relates to the field of mail sorters and, more particularly, to an improved mail sorter of the type having one or more series of bin assemblies arranged for movement along a single path. In one type of mail sorter, a series of bin assemblies are mounted for movement along a common path in a horizontal direction. Each bin assembly has a plurality of bins for receiving mail pieces therein and is adapted to move from a position whereat the bins of each assembly are vertically aligned to the common path for receiving mail pieces thereinto to a position whereat the bins of each assembly are vertically offset from the common path for holding mail pieces in the bins during transport to the next

assembly. The bins of one bin assembly are moved to the vertical offset position before the bins of the next assembly are moved to the vertical offset position, and this process continues for each bin assembly of the series. Mail sorters of this type are typically manually operated. The postal service employer is required to keep a large number of mail sorters in operation because the mail sorter must process a large volume of mail. This results in substantial maintenance costs for a postal service employer. In addition, the mail sorter is very labor intensive because each bin assembly must be moved manually, and requires two people for operation. Consequently, the mail sorter is expensive and unreliable. It is also difficult to automate the operation of the mail sorter so that it is automatically operated, but without requiring a large number of people to operate it. It is desirable to provide a reliable mail sorter that can be operated by 5b5f913d15
