Field of the Invention This invention relates to a method for making a lead acid battery. 2. Background Information Lead acid batteries are usually formed by assembling a plurality of lead plates with a positive and negative grid with one of the ends of the positive and negative grids connected to terminals, the battery being enclosed in a case. The positive plate and negative plate are provided with active material including lead and lead oxide, each plate being held in position by a lead sheet which holds a mixture of lead oxide and sulfuric acid which act as an electrolyte. The lead plates are usually manufactured by first forming a plate by pressing a lead alloy, the desired shape of the plate being determined by a punching or milling operation. After the desired shape is formed, the plate is immersed in sulfuric acid which is generally continuously sprayed on the surface of the plate through a wire screen which may be provided with a perforated pattern. The acid first contacts the lead alloy and then the lead which is of the desired thickness. When the lead plate is fully immersed in the sulfuric acid, the acid saturates the lead. After the plate is removed from the acid, it is placed in a furnace and heated to an elevated temperature such as between 400.degree. and 800.degree. C., thereby causing the lead oxide in the plate to become reduced and to deposit on the plate. After the desired degree of reduction is achieved, the plate is usually immersed in water to remove the sludge which is formed during the reduction process. After the desired degree of reduction is obtained, the plate is immersed in a solution of a1d647c40b

## What's New In?

Automatically convert graphical text such as filenames to text. Automatically create layers in a group for new drawings, with support for importing external data. Automatically import pre-existing data from external data sources, including PDFs and AutoCAD or other CAD models, and import layers from other drawings. Streamline the drawing process by using robust markup tools. Use text markup, layer and block properties, and shape annotations to add notes and focus your attention on the drawing area. Use annotations to write text notes on a component or guide you through the drawing process. Use layer properties to make changes to existing layers or to create new layers. Create dynamic wallpapers by adding real-time dynamic data to your drawings. Use a local map to define a new layer based on a specific location. (video: 1:22 min.) Enable precision annotation of drawings using the support for the new measurement system. The figure and dimension styles are being revised to match the user interface design of the latest released application. Drawing and editing: The new drawing system supports large 2D drawings with enhancements for clarity and performance. Use the new drawing tools to plan, edit, and analyze your drawings. (video: 1:24 min.) With the enhancements for text scaling, text objects can be scaled without losing accuracy or leading to broken lines. Graphical editing tools such as the Line, Rectangle, Freeform, and Ellipse commands are being enhanced to provide full support for the new drawing system. Improved drawing tools improve the performance of complex drawing processes. For example, the Ellipse tool now maintains a fixed bounding box for easy editing and provides the option to select a center point in the Ellipse's bounding box. The DrawEllipse tool now works as a draw-on-shape tool for full support of the Ellipse command. For line drawings, the command supports such enhancements as arc distortion and improved line snapping. The Line Object tool has a new paint mode for smoothing linework. For instance, a graphically enhanced snap tool is now available to edit the lines of a line pattern. Graphics and support: With the enhancements for drawing tools, the commands, tools, and objects are being redesigned. The drawing system is being enhanced to provide more options for drawing, analyzing, and managing complex drawings.
