Faster & more secure uploading & downloading of data over the Internet. Based on HTTP and HTTPS protocols, allowing to upload, download and share content over secure, private and fast data communication. What is a Secure Tunnel? A secure tunnel is a virtual private network (VPN) that works over TCP/IP and provides users with secured connections between their computers and remote access servers. All communications are transmitted through a secure tunnel over an encrypted channel. Secure tunnels give access to remote servers and resources, and allow remote access to LAN and WAN resources. This provides secure, encrypted communication between remote users and computers. Connection Types Connecting to a secure tunnel is performed in two steps. First you need to specify the remote address, port, protocol, and type of connection to establish the tunnel. Once the tunnel is established, you need to logon to the remote server by entering credentials that you use for normal communication. Basic Types of Secure Tunnel You can have a secured tunnel of two basic types: tunneled or unencrypted. Tunneled tunnels provide secured communication using existing Internet communications methods. Tunneled connections are made by establishing TCP/IP connections to a remote server through a secured tunnel. They are secure and cannot be eavesdropped, but their performance is limited to that of an ordinary TCP/IP connection. Unencrypted tunnels provide secured communication using existing Internet communications methods. Tunneled connections are made by establishing TCP/IP connections to a remote server through a secured tunnel. They are secure and cannot be eavesdropped, but their performance is limited to that of an ordinary TCP/IP connection. Secure Tunneling Methods Secure tunnels can be tunneled over HTTP or HTTPS protocols. For HTTP tunnels, you must specify the remote address and port number to establish the connection. In the case of HTTPS tunnels, you must enter the user name and password. HTTPS tunneling can be used to secure remote access to your LAN, or in combination with Internet communications methods to secure remote communications with other remote users. If you have a corporate environment, you can also use a secure tunnel to secure remote access to your intranet. Firewalls In order to connect to a secure tunnel, your computer must have the capability to work with the encryption keys associated with the tunnel. This requires that your computer has a valid Digital Certificate. You must first obtain a certificate from a Certificate Authority (CA). This will give your computer the ability to connect to the encrypted tunnel. Your computer also needs to have an Internet
