The manufacturer of this application, Panasonic, has made no changes to the application for you, to work around this issue, we encourage you to report the bug to the developers. Sep 6, 2016 The length of time the issue I am about to talk about has been reported is a little longer than I would wish. A while ago someone reported an issue that was similar to the issue that I am about to talk about, and when I tried to contact the person through the support links, I found out that it was a programme but that Panasonic were not going to make any changes to fix the issue. So I am going to describe the issue I'm about to talk about, and I ask you to help me report this as a bug for their programme. I have read a few different versions of the user guide for this programme and I can find no mention of what the programme does in the case of a crash, or if the programme fails to start, when it's not the fault of the user of course. It's a programme written by Panasonic, so if they have just not considered this issue and it's not a bug, is there anyone there that would like to take that responsibility on themselves? (I'm not sure what the support email address is) I have gone through the user guide several times and have found no explanation of what to do in the event of a crash. The user guide says "If the program fails, or does not start, go to the last log file and follow the instructions there". The issue I am about to talk about means that the log file is not created and any explanations in that file are not there. I have spoken to Panasonic and asked for a log file that would be created on crashes but they have made no response as yet. Anyways I am going to try and explain what happens when it fails to start, so if it does fail to start and you want to help me find out why, check these two log files. In the log files you will find the following: [4/17/15 2:37:48 55cdc1ed1c
