If you install a file manager from a third party, you will not be able to access the files in the "Program Files" folder unless you set the folder to be accessible by everyone. For more information, see UAC settings. Note: The file manager that is installed on a Vista operating system is the MS Office package. Tip: In a Windows Vista operating system, you should be able to access your user folders by default. Windows Vista provides better control over file and folder permissions than previous Windows versions. When you install a third-party file manager on your Windows Vista operating system, you should be able to access your user folders by default. If the icon for your user folder (in your "My Documents" or "My Pictures" folder) is missing or incorrect, go to Control Panel and select Folder Options. Under the View tab, click the "Show hidden files, folders, and drives" check box, and then click OK. Double-click "My Documents" or "My Pictures" to access the folder, and then select the "Show hidden files, folders, and drives" check box again, and then click OK. Note: The icon for the "My Documents" or "My Pictures" folder that is missing or incorrect is not necessarily indicative of having file permissions problems. It could also be that the "My Documents" or "My Pictures" folder is actually the Program Files folder (for example, C:\Program Files\My Documents). In this case, you should follow the steps above to access your user folders. For more information on file and folder permissions, see Windows Vista File and Folder Permissions. You will see a different group of menus and buttons in the menu bar. For example, when you open the program, you will see a File menu and a Tools menu, instead of the File menu and the Edit menu. 2. - Displays a dialog box with instructions on how to use KEYMACRO for performing various operations on a Microsoft Windows keyboard.Q: Unable to retrieve data from a table in SQLite I'm trying to retrieve data from my SQLite database and it's giving me a really strange error. I have some code like this: try { String sql_select = "SELECT * FROM "+ TABLE_CATALOGS; SQLiteDatabase db = dbHelper.getWritableDatabase(); Cursor c = db.rawQuery(sql_select, null); c.moveToFirst(); do { Log.i(TAG, c.getString(c.getColumnIndex(dbHelper.KEY_NAME))); Log.i(TAG, c.getString(c.getColumnIndex(dbHelper.KEY_PRICE))); } while (c.moveToNext()); } catch (Exception e) { Log.e(TAG, "Failed to get: " + e.toString()); } The logs show the proper data when I try to do the loop in the above code, but once it gets to the Log.i() statement it gives me this error: Failed to get: android.database.sqlite.SQLiteException: no such column: com.example.sampleapplication.db.TABLE_CATALOGS; while compiling: SELECT * FROM com.example.sampleapplication.db.TABLE_CATALOGS A: You should really write your code like this. You are returning resultset, which means that in your code, you have to query the database to retrieve the data. Try this instead. SQLiteDatabase db = dbHelper.getWritableDatabase(); Cursor c = db.rawQuery("SELECT * FROM "+ TABLE_CATALOGS, null); If you do not return any value, then your code would be: SQLiteDatabase db = dbHelper.getWritableDatabase(); C 77a5ca646e
