PC.2\$ for the the three-dimensional case), we have verified our theoretical results by performing Monte Carlo simulations, confirming the linear scaling of the relative bias and its decreasing, leading to the stable form. This is illustrated in Fig. . . [Shown is the median of 10,000 realisations of Y based on the observed graph G when using SRR as a random graph model. The dotted red line represents the theoretical result, whereas the blue line shows the average of the relative bias. The results are given for the estimated mean $\hat{\mu}(G)$ of the SRR graph model. The median of the 10,000 realisations of Y are calculated in each case.  (figures/SRR.pdf) In the next example, we verify our theoretical results also for the edge structure of the shortest path random graph model (SPRM) introduced in [Janssen2014structural], which recently has been shown to be an asymptotically uniform graph model with respect to the number of edges. More precisely, we consider the setting from Example 4 in [Janssen2014structural]. In this example, n nodes are arranged in a ring structure, and the edge set contains all shortest paths that can be drawn between them. We make use of the method suggested in Example 4, section 6.1, to perform Monte Carlo simulations. For this example, we choose $n=500$ and $p=0.5$. This means that the expected number of edges in the shortest path random graph model is $E[\operatorname{sp}] \approx \frac{0.5 \cdot n^2 \cdot p}{1-p} \approx 100$. We set $\alpha = 0.5$ and $\beta = 0.1$. Note that this β value is slightly larger than the one in the previous example. Indeed, for the general case, there will be some bias due to the fact that, on average, G will contain more edges than $G_$

Convergence of Culture Convergence of Culture is the point at which the dominant technologies, artifacts, organizations, ideas, and values of one culture begin to influence that of another. The use of the term began in the early 20th century, with Herbert H. Howe's 1917 book of the same name, and is "a way of looking at things". It is a way to help people understand cultural transitions, and in that sense it was a useful term. Since that time, however, it has fallen into disuse, replaced by the concept of secularization. Howe claimed his book represented "a new departure in the theory and interpretation of history", which attempted to see history in terms of "discrete cultures, from the primitive to the modern, and from the remote to the recent past". This book "was an evolutionary view of society, with the primitive of one culture serving as the prototype of the more advanced culture of another, and the modern as the product of the culmination of this evolutionary development." The use of the term "convergence" in

"convergence of culture", as in "convergence of culture and literature", was first used in reference to a 1949 article by Arthur Dailey in *The American Scholar*, which had an influence on the development of convergence theory, and its application to the study of second-

A device that is not responding or not responding correctly is known as a nuisance, nonresponding, or passive component. A power supply that is unable to provide proper power to a circuit board, or a device that is not powering on or is not providing needed power to a device is called a nuisance circuit. Common symptoms of a passive component include a remote control that malfunctions when tuned in,. Passive circuits will most often be seen where the power is not controlled and it

The isocitrate dehydrogenase gene (IDH) is frequently mutated in glioblastoma (GBM), a lethal disease for which there is no cure. However, the impact of these mutations on gene expression programs and cell survival have not been well studied. We hypothesized that the IDH mutation confers a favorable tumor phenotype by reducing cytotoxic metabolism and inducing the 'glio-epi' phenotype. Using microarray expression analysis of 190 glioma tumor samples, we observed that the IDH mutant subset was enriched for genes encoding markers of neural stem/progenitor cells. Consistent with this conclusion, we found that IDH mutant cells from GBM cell lines were enriched for neural stem/progenitor cell markers, and that knockdown of IDH1 and -2 led to reduction of neural stem/progenitor cell markers. A reduction in oxidative metabolism was observed by Seahorse profiling. We also found that IDH1-initiated cells were more sensitive to glucose deprivation, which we show is a direct consequence of the reprogramming of metabolism to lactate production. This chemotactic gradient contributed to the accumulation of the IDH1 mutant cells at the tumor

margin in vivo. The mechanism by which IDH1 alters cellular metabolism remains unknown, but it appears to be independent of the oncogenic function of mutant IDH in driving DNA hypermethylation. Importantly, inhibition of lactate production by 2-HG inhibited GBM growth in vitro and in vivo. We found that asparagine synthase (ASNS), the primary enzyme involved in production of asparagine from glutamine, is an important target of mutant IDH enzymes. ASNS is expressed in GBM cells and tumors, and its inhibition has a favorable effect on tumor growth in vivo. Mechanistically, we found that the IDH1 mutant alters ASNS expression at the transcriptional level by binding to the promoter. Collectively, our data suggest that IDH mutant cancers are linked to an altered metabolic state that fosters tumor growth in part by directing migration and survival of IDH mutant cells. We hypothesize that the metabolic state imparted by the IDH mutation is a favorable feature of the tumor and may contribute to the GBM survival advantage. In the proposed studies, we will characterize the
