Electronic devices such as digital televisions, set-top boxes, cable modems, and modems have become very popular in recent years. For most applications, the use of all or a subset of the features provided by these electronic devices requires that the devices be coupled to a transmission line. In order to implement the functionality of the electronic devices, the devices typically require the transmission line to be monitored to determine the voltage level of the line. Monitoring the transmission line can present a number of problems, however. For example, analog lines may present a number of drawbacks to the operation of digital devices. Typically, a device is only designed to operate using a predetermined voltage range. Thus, if the voltage level of the transmission line deviates from the predetermined voltage range, the operation of the device may not be satisfactory. Moreover, the transmission line is typically constructed of copper, and the impedance of the copper line increases as a
